04 — Weekly Cadence & Platform Playbooks

Weekly operating cycle

Day	Machine	Samuel
Mon	Strategist posts weekly plan as a GitHub Issue comment; 5-line summary	Approve/adjust (2 min)
Mon–Tue	Researcher → Producer (hero + derivatives) → Evidence Keeper refresh	—
Wed	Content CI + QA scoring; failures file Issue text	—
Thu 06:00 EAT	Actions cron fallback run; digest at `content/review/<week>-digest.md`	**Main session: `make review`, 30–60 min**
Fri–Sun	Growth Analyst waits; Producer revises rejected items from Thursday decisions	Publish manually at own pace; paste stats when convenient
Sun night	Analytics ingest; Edit Loop distillation; next-week preview	Optional skim

Resilience rule: if any step fails, that week's digest is marked DEGRADED with the failure logged — Samuel never receives silence and never receives garbage.

Publishing is manual, always

The system has no credentials for any platform and never will in this architecture. Samuel posts each approved item personally. Platform schedulers (native YouTube/TikTok/FB scheduling) may be used by Samuel at his discretion; the engine never touches them.

Platform playbooks

YouTube — home of FMT-01. Deliverables per item: title options, thumbnail brief, outline, full script, description with receipts linked (repo, Actions run). Shorts = sliced FMT-01/FMT-02 moments with re-captioned hooks.

TikTok — Verification Files + build moments. Hook lands inside 1.5 seconds; receipts on screen (terminal, CI badge, artifact); zero fluff; vertical 9:16.

Instagram — Reels (TikTok derivatives, re-captioned, re-thumbnailed)

- carousels ("5 things building a company on a phone taught me" — evidence-styled slides in Deep Muse Blue `#0A2463`).

Facebook — Kenyan audience. FMT-03 (Blueprint) lives here; longer-form founder notes; school-owner language, not builder language. Community tone: answer comments personally.

Language & register (reinforced)

Default English. Kenyan conversational register for Kenya-targeted campaigns. Sheng only where Samuel would naturally use it. Format and register come from `brand/voice-fingerprint.md`, not from agent taste.

Atomization (the law)

One hero asset per cycle → derivatives per platform. Derivatives must reuse the hero's substance; platform-native re-expression is required (copy-paste across platforms is a VOICE/WRONG_AUDIENCE reject).
